

CYPRESS SEMICONDUCTOR

16,384 x 4 Static R/W RAM  
Separate I/O

CY7C161  
CY7C162

T-46-23-10

Features

- Automatic power-down when deselected
- Transparent write (7C161)
- CMOS for optimum speed/power
- High speed  
— 15 ns  $t_{AA}$
- Low active power  
— 633 mW
- Low standby power  
— 220 mW
- TTL compatible inputs and outputs

- Capable of withstanding greater than 2001V electrostatic discharge.

Functional Description

The CY7C161 and CY7C162 are high-performance CMOS static RAMs organized as 16,384 by 4 bits with separate I/O. Easy memory expansion is provided by active LOW chip enables ( $\overline{CE}_1$ ,  $\overline{CE}_2$ ) and three-state drivers. They have an automatic power-down feature, reducing the power consumption by 65% when deselected.

Writing to the device is accomplished when the chip enable ( $\overline{CE}_1$ ,  $\overline{CE}_2$ ) and write enable (WE) inputs are both LOW. Data on the four input pins ( $I_0$  through  $I_3$ ) is written

into the memory location specified on the address pins ( $A_0$  through  $A_{13}$ ).

Reading the device is accomplished by taking the chip enables ( $\overline{CE}_1$ ,  $\overline{CE}_2$ ) LOW while write enable (WE) remains HIGH. Under these conditions the contents of the memory location specified on the address pins will appear on the four data output pins.

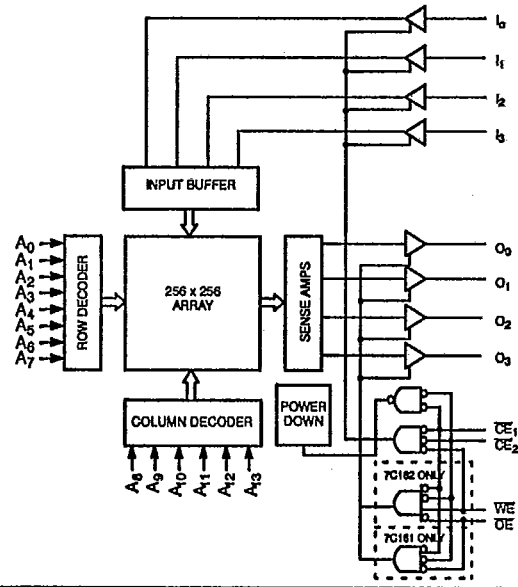

The output pins stay in high-impedance state when write enable (WE) is LOW (7C162 only), or one of the chip enables ( $\overline{CE}_1$ ,  $\overline{CE}_2$ ) are HIGH.

A die coat is used to insure alpha immunity.

**Maximum Ratings**

(Above which the useful life may be impaired. For user guidelines, not tested.)

- Storage Temperature ..... - 65°C to +150°C
- Ambient Temperature with Power Applied ..... - 55°C to +125°C
- Supply Voltage to Ground Potential (Pin 24 to Pin 12) ..... - 0.5V to +7.0V
- DC Voltage Applied to Outputs in High Z State ..... - 0.5V to +7.0V
- DC Input Voltage ..... - 3.0V to + 7.0V

- Output Current into Outputs (LOW) ..... 20 mA
- Static Discharge Voltage ..... >2001V (per MIL-STD-883, Method 3015)
- Latch-Up Current ..... >200 mA

**Operating Range**

Range	Ambient Temperature	V <sub>CC</sub>
Commercial	0°C to + 70°C	5V ± 10%

**Electrical Characteristics Over the Operating Range**

Notes:

- Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I<sub>OL</sub>/I<sub>OH</sub> and 30-pF load capacitance.
- Both  $\overline{CE}_1$  and  $\overline{CE}_2$  are represented by  $\overline{CE}$  in the Switching Characteristics and Waveforms sections.
- At any given temperature and voltage condition, t<sub>HZ</sub> is less than t<sub>LZ</sub> for any given device.
- t<sub>HZCE</sub> and t<sub>HZWE</sub> are specified with C<sub>L</sub> = 5 pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady state voltage.
- The internal write time of the memory is defined by the overlap of  $\overline{CE}_1$  LOW,  $\overline{CE}_2$  LOW, and  $\overline{WE}$  LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
