

## +1.8V, Low Power, 16-Bit Sigma-Delta A/D Converter

### Features

- 16-bit Resolution at Eight Conversions Per Second, Adjustable Down to 10-bit Resolution at 512 Conversions Per Second
- 1.8V – 5.5V Operation, Low Power Operating 260 $\mu$ A; Sleep: 0.75 $\mu$ A
- microPort™ Serial Bus Requires only two Interface Lines
- Uses Internal or External Reference
- Automatically Enters Sleep Mode when not in use

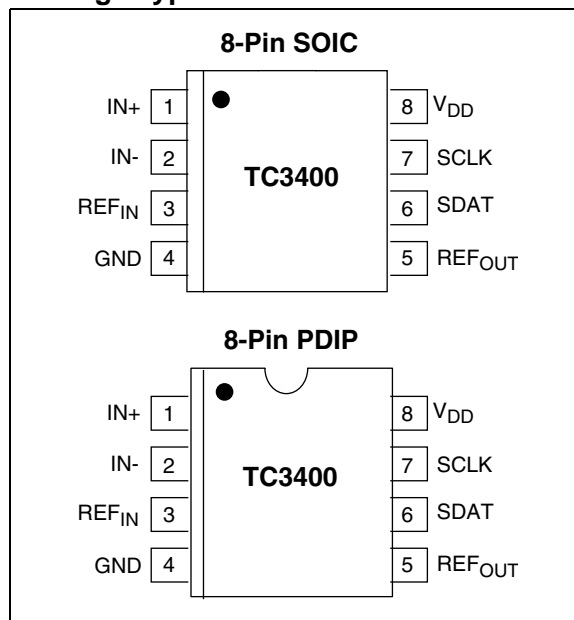

### Applications

- Consumer Electronics, Thermostats, CO Monitors, Humidity Meters, Security Sensors
- Embedded Systems, Data Loggers, Portable Equipment
- Medical Instruments

### Device Selection Table

Part Number	Package	Temperature Range
TC3400VPA	8-Pin PDIP (Narrow)	0°C to +85°C
TC3400VOA	8-Pin SOIC (Narrow)	0°C to +85°C

### Package Type

### General Description

The TC3400 is a low cost, low power analog-to-digital converter based on Microchip's Sigma-Delta technology. It will perform 16-bit conversions (15-bit plus sign) at up to eight per second. The TC3400 is optimized for use as a microcontroller peripheral in low cost, battery operated systems. A voltage reference is included, or an external reference can be used.

The TC3400's 2-wire microPort™ digital interface is used for starting conversions and for reading out the data. Driving the SCLK line low starts a conversion. After the conversion starts, each additional falling edge (up to six) detected on SCLK for  $t_4$  seconds reduces the A/D resolution by one bit and cuts conversion time in half. After a conversion is completed, clocking the SCLK line puts the MSB through LSB of the resulting data word onto the SDAT line, much like a shift register. The part automatically sleeps when not performing a data conversion.

The TC3400 is available in a 8-Pin PDIP and a 8-Pin SOIC package.

# TC3400

## Typical Application

## Functional Block Diagram

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings\*

Supply Voltage .....	6.0V
Input Voltage (All Other Pins):	
..... (GND – 0.3V) to (V <sub>DD</sub> + 0.3V)	
Operating Temperature Range .....	0°C to 85°C
Storage Temperature .....	-65°C to +150°C

\*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

### TC3400 DC ELECTRICAL SPECIFICATIONS

**Electrical Characteristics:** T<sub>A</sub> = 25°C and V<sub>DD</sub> = 2.7V, unless otherwise specified. **Boldface** type specifications apply for temperatures of 0°C to 85°C. V<sub>REF</sub> = 1.25V, Internal Clock Frequency = 520kHz.

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
<b>Power Supply</b>						
V <sub>DD</sub>	Supply Voltage	1.8	—	5.5	V	
I <sub>DD</sub>	Supply Current, During Data Conversion	—	260	—	μA

- Note 1:** Nominal temperature drift is  $-2830\text{ppm}/^\circ\text{C}$  for temperature less than  $25^\circ\text{C}$  and  $-1340\text{ppm}/^\circ\text{C}$  for temperatures greater than  $25^\circ\text{C}$ .

## 2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

**TABLE 2-1: PIN FUNCTION TABLE**

Pin No. (8-Pin SOIC) (8-Pin PDIP)	Symbol	Description
1	IN+	Analog Input. This is the positive terminal of a true differential input consisting of IN+ and IN-. $V_{IN1} = (IN+ - IN-)$ . See Section 1.0 Electrical Characteristics.
2	IN-	Analog Input. This is the negative terminal of a true differential input consisting of IN+ and IN-. $V_{IN} = (IN+ - IN-)$ IN- can swing to, but not below, ground.
3	REF <sub>IN</sub>	Analog Input. The converter's reference voltage is the differential between this pin and ground times two. It may be tied directly to REF <sub>OUT</sub> or scaled using a resistor divider. Any user supplied reference voltage less than 1.25V may be used in place of REF <sub>OUT</sub> .
4	GND	Ground Terminal.
5	REF <sub>OUT</sub>	Analog Output. The internal reference connects to this pin. It may be scaled externally, if desired, and tied to the REF <sub>IN</sub> input to provide the converter's reference voltage. Care must be taken in connecting external circuitry to this pin.
6	SDAT	Digital Output (push-pull). This is the microPort™ serial data output. SDAT is driven low while the TC3400 is converting data, effectively providing a "busy" signal. After the conversion is complete, every high to low transition on the SCLK pin puts a bit from the resulting data word on the SDAT pin (from MSB to LSB).
7	SCLK	Digital Input. This is the microPort™ serial clock input. The TC3400 comes out of sleep mode and a conversion cycle begins when this pin is driven low. After the conversion starts, each additional falling edge (up to six) detected on SCLK for $t_4$ seconds reduces the A/D resolution by one bit. When the conversion is complete, the data word can be shifted out on the SDAT pin by clocking the SCLK pin.
8	V <sub>DD</sub>	Power Supply Input.

## 3.0 DETAILED DESCRIPTION

The TC3400 is a 16-bit sigma-delta A/D converter with one differential input. See the Typical Application circuit and the Functional Block diagram. The key components of the TC3400 are described below.

Also refer to Figure 3-4, A/D Operational Flowchart and the Timing Diagrams, Figure 3-1, Figure 3-2 and Figure 3-3).

### 3.1 A/D Converter Operation

When the TC3400 is not converting, it is in sleep mode with both the SCLK and SDAT lines high. An A/D conversion is initiated by a high to low transition on the SCLK line at which time the internal clock of the TC3400 is started. Each additional high to low transition of SCLK (following the initial SCLK falling edge) during the time interval  $t_4$ , will decrement the conversion resolution by one bit and reduce the conversion time by one half. The time interval  $t_4$  is referred to as the resolution reduction window. The minimum conversion resolution is 10-bits so any more than 6 SCLK transitions during  $t_4$  will be ignored.

After each high to low transition of SCLK, in the  $t_4$  interval, the SDAT output is driven high by the TC3400 to acknowledge that the conversion has been decremented. When the SCLK returns high or the  $t_4$  interval ends, the SDAT line returns low (see Figure 3-2). When the conversion is complete SDAT is driven high. The TC3400 now enters sleep mode and the conversion value can be read as a serial data word on the SDAT line.

### 3.2 Reading the Data Word

After the conversion is complete and SDAT goes high, the conversion value can be clocked serially onto the SDAT line by high to low transitions of the SCLK. The data word is in two's complement format with the sign bit clocked onto the SDAT line, first followed by the MSB and ending in the LSB. For a 16-bit conversion the data word would consist of a sign bit followed by 15 magnitude bits, Table 3-1 shows the data word versus input voltage for a 16-bit conversion. Note that the full scale input voltage range is  $\pm(2 \text{ REF}_{IN} - 1\text{LSB})$ . When  $\text{REF}_{OUT}$  is fed back directly to  $\text{REF}_{IN}$ , an LSB is  $73\mu\text{V}$  for a 16-bit conversion, as  $\text{REF}_{OUT}$  is typically 1.193V.

Figure 3-3 shows typical SCLK and SDAT waveforms for 16, 12 and 10-bit conversions. Note that any complete convert and read cycle requires 17 negative edge clock pulses. The first is the convert command. Then, up to six of these can occur in the resolution reduction window,  $t_4$ , to decrement resolution. The remaining pulses clock out the conversion data word.

**TABLE 3-1: DATA CONVERSION WORD VS. VOLTAGE INPUT ( $\text{REF}_{IN} = 1.193\text{V}$ )**

Data Word	INn+ – INn- (Volts)
0111 1111 1111 1111	2.38596 (Positive Full Scale)
0000 0000 0000 0001	72.8 E -6
0000 0000 0000 0000	0
1111 1111 1111 1111	-72.8 E -6
1000 0000 0000 0001	-2.38596 (Negative Full Scale)
1000 0000 0000 0000	Reserved Code

The SCLK input has a filter which rejects any positive or negative pulse of width less than 50nsec to reduce noise. The rejection width of this pulse can vary between 50nsec and 750nsec depending on processing parameters and supply voltage.

Figure 3-1 and Table 3-2 show information for determining the mode of operation for the TC3400 part by recording the value of SDAT for SCLK in a high, then low, then high state. For example, if SCLK goes through a 1-0-1 transition and the corresponding values of SDAT are 1-1-0, then the SCLK falling edge started a new data conversion. A 0-1-0 for SDAT would have indicated a resolution reduction had occurred. This is useful if the microcontroller has a watchdog reset or otherwise loses track of where the TC3400 is in the conversion and data readout sequence. The microcontroller can simply transition SCLK until it "finds" a Start Conversion condition.

**FIGURE 3-1: SCLK, SDAT LOGIC STATE DIAGRAM**

**TABLE 3-2: SCLK, SDAT LOGIC STATE**

A	B	C	Status
1	1	0	Start Conversion
0	1	0	Resolution Reduction
x	1	1	Data Transfer
x	0	0	Data Transfer or Busy*

**\*Note:** The code X00 has a dual meaning: Data Transfer or Busy converting. To avoid confusion, the user should send only the required number of pulses for the desired resolution, then wait for SDAT to rise to 1, indicating conversion is complete before clocking SCLK again to read out data bits.

## SALES AND SUPPORT

### **Data Sheets**

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### **New Customer Notification System**

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.
